

# Steps to setup the cluster using docker compose

1. Launch the instance through brev UI using the launchable for vss.

The screenshot shows the Brev UI interface. At the top, it displays a container named 'vss-event-reviewer-4f3550' with details: NVIDIA L40S (48GB), 1 GPU x 8 CPUs | 32GB, 476GB, 89.169.110.237, eu-north1, nebus, \$1.62/hr, Running. Below this, there are tabs for VM Mode (selected) and Built. A 'Logs' tab is also visible. The main area is titled 'Using Brev CLI (SSH)' and contains four sections: 'Install the CLI' (macOS), 'Login to your account', 'Open a terminal locally', and 'Open in Code Editor'. Each section has a 'Run this in your terminal' input field with a command example.

2. Check the file storage space using ‘`df -h`’ in a terminal window on the jupyter notebook - to verify if sufficient storage is available in the root directory “/”

```
ubuntu@brev-wmq28u2lc:~$ df -h
Filesystem      Size  Used Avail Use% Mounted on
tmpfs          3.2G   2.6M  3.2G  1% /run
/dev/vda1       461G  18G  443G  4% /
tmpfs          16G    0   16G  0% /dev/shm
tmpfs          5.0M    0   5.0M  0% /run/lock
/dev/vda16     881M  180M  640M  22% /boot
/dev/vda15      105M  6.2M  99M  6% /boot/efi
cloud-metadata  252G  16K  252G  1% /mnt/cloud-metadata
tmpfs          3.2G   16K  3.2G  1% /run/user/1000
```

3. [Optional] For cloud providers like CRUSOE, the main data mount is stored in a path like “/ephemeral”. Add this path to the “/etc/docker/daemon.json” using ‘`sudo vi /etc/docker/daemon.json`’ and restart docker ‘`sudo systemctl restart docker`’

```
ubuntu@brev-gfzu85n8u:~$ cat /etc/docker/daemon.json
{
  "default-runtime": "nvidia",
  "data-root":"/ephemeral/docker",
  "mtu": 1500,
  "runtimes": {
    "nvidia": {
      "args": [],
      "path": "nvidia-container-runtime"
    }
  }
}
ubuntu@brev-gfzu85n8u:~/video-search-and-summarization/deploy/docker/event_reviewer$ sudo systemctl restart docker
ubuntu@brev-gfzu85n8u:~/video-search-and-summarization/deploy/docker/event_reviewer$ docker info | grep 'Docker Root Dir'
WARNING: bridge-nf-call-iptables is disabled
WARNING: bridge-nf-call-ip6tables is disabled
Docker Root Dir: /ephemeral/docker
```

4. Go to the parent directory ‘`cd ~`’ and git clone the VSS repository ‘`git clone https://github.com/NVIDIA-AI-Blueprints/video-search-and-`

## **summarization.git'**

```
ubuntu@brev-gfzu85n8u:~/event_reviewer_workshop$ cd ~
ubuntu@brev-gfzu85n8u:~$ git clone https://github.com/NVIDIA-AI-Blueprints/video-search-and-summarization.git
Cloning into 'video-search-and-summarization'...

Resolving deltas: 100% (385/385), done.
```

5. Move into the folder 'cd ~/video-search-and-summarization/deploy/docker/event\_reviewer'

6. Use NGC API key from section [Obtain NGC API Key](#).

Update `NGC_API_KEY` environment variable in `.env` file to a valid key.

```
#VLM_INPUT_WIDTH=728          # For CR1 4K context length
#VLM_INPUT_HEIGHT=420          # For CR1 4K context length

#VLM_INPUT_WIDTH=1484          # For CR1 16K context length
#VLM_INPUT_HEIGHT=840          # For CR1 16K context length

#VSS_IMAGE=
#NV_CV_EVENT_DETECTOR_IMAGE=
#ALERT_INSPECTOR_UI_IMAGE=
#CV_UI_IMAGE=

# Update to download Cosmos-Reason1 from NGC
NGC_API_KEY=XX

NVIDIA_VISIBLE_DEVICES=all
# You can config the VST configs from below (Must be absolute path)
VST_CONFIG_PATH=${PWD}/vst/config

# You can config the VST volume from below (Must be absolute path)
VST_VOLUME=${PWD}/vst/vst_volume

VST_DATA_PATH=${VST_VOLUME}/vst_data
VST_VIDEO_STORAGE_PATH=${VST_VOLUME}/vst_video
VST_LOGS=${VST_DATA_PATH}/logs

STORAGE_HTTP_PORT=30000

# Additional packages are needed for certain use cases (e.g., audio, software encoding-decoding, video downloading).
# To install these packages, set VST_INSTALL_ADDITIONAL_PACKAGES=true.
VST_INSTALL_ADDITIONAL_PACKAGES=true
```

~  
~  
~

7. For running on L40S update the model path to

`git:https://huggingface.co/nvidia/Cosmos-Reason1-7B` as default FP8 is not supported

### **Note**

Cosmos-Reason1 7b FP8 (default) is not supported on L40s. Use Cosmos-Reason1 7b FP16 instead by setting `MODEL_PATH` to `git:https://huggingface.co/nvidia/Cosmos-Reason1-7B` in the Helm overrides file as shown in [Configuration Options](#).

on L40S.

8. Run the command as '**ALERT REVIEW MEDIA BASE DIR=/tmp/alert-media-dir MODEL PATH=git:https://huggingface.co/nvidia/Cosmos-Reason1-7B docker compose up -d**' and change permissions of the '/tmp/alert-media-dir' to 777.

```

shanthi@shanthi-OptiPlex-5090:~/video-search-and-summarization/deploy/docker$ event_reviewer$ ALERT_REVIEWS_MEDIA_BASE_DIR=/tmp/alert-media-dir MODEL_PATH=git+https://huggingface.co/nvidia/Cosmo-Reason1-7B docker compose up -d
